

Demonstrations

Marking Scheme

Version 2.0

Understanding theoretical course material is often aided by gaining practical experience with the content. Particularly, when it is necessary to show complex and computationally intensive results from computer science and artificial intelligence. Programming experience and software engineering practices are also key in using one of the most important tools in computer science – the computer!

Demonstrations are a keyway to gauge your progress and query your understanding, but also to ascertain if the work is truly yours. It is also a way to show the teaching team your development as a computer/data scientist. As such, this marking scheme for demonstrations is designed to standardise the process and enable you to focus your time appropriately.

Rationale

Think of this demo as a way of reporting to your team leader in a work scenario (i.e. when you enter the workplace), where your immediate team leader may want additional details and query whether the work is fit for purpose, as well as re-useable by the rest of the team. In this type of scenario, it is critical that you are able to convince your team leader (the demonstrator in this case) that you met all of the criteria of the project brief.

Ownership of Assessment

This demo is designed to assist you in understanding the course material and to learn how to conduct yourself in a simulated work environment for your benefit through a demonstration assessment. As such, we require that you take ownership of your submitted/demonstrated work by showing that you meet academic integrity/plagiarism standards and understand the material, as well as its learning objectives. Not doing so deprives you of the learning experiences we are attempting to provide in this course and likely affect your grade negatively.

Length and Format

The demonstration (hereon referred to as simply the demo) will be a **minimum** of approximately 5 mins in total length for each student. The actual total time taken maybe longer due to additional demonstrator questions as per below. During this time, the student is encouraged to present their work for the assessment task being demo'd in around 3 mins. Your presentation should include:

1. A run down of the tasks completed via the code you have implemented or short courses done
2. Explanation of each of the specific demo items requested by the demo sheet
3. Explanation of the workflow that you have used, such as the Git workflow and design
4. If AI tools or any other similar tools have been used, provide any relevant supporting evidence as per acceptable/fair AI use section below.

The demonstrator will then examine your work as to ascertain if the work is as you have presented it and can ask follow up questions to test your knowledge. These questions will relate to the demo items, your workflow, the code you have written and your understanding of these items and the demo overall. An additional demonstrator may be present during the demo to moderate. They may also ask you to explain sections of your own code and architecture to gauge its validity. Thus, the demonstrator may take additional minutes as they see fit if they feel they need to query you further.

Location and ID

The demo will be conducted during your allotted practical time and you must present your demo in-person at this time. If you have an extension or a particular circumstance with evidence (such as a Student Access Plan (SAP) and medical certificates), you should have this arranged with the course coordinator. You must be able to identify yourself (name etc.) to the demonstrator so they know who they are marking (your ID card is the easiest way). The teaching team reserve the right to ask for your ID if they require more information.

Marking Scheme

The teaching team will examine your work and evaluate your demonstration. The goal is to ascertain how well you have understood the course content being covered by the Demonstration Laboratory Sheet and that you have taken full ownership of your work (see Ownership section above). The demonstrator will then award your mark based on the following:

- I. Student **demonstrates functional code** from the relevant Demonstration Laboratory Sheet. The marks will be awarded on the proportion of the tasks completed.
(20% of Marks)
- II. The student has **answered the relevant questions** from the demonstrator and **shows good understanding and ownership** the course material that is covered by the Demonstration Laboratory.
(40% of Marks)
- III. The student shows **excellent understanding** the course material that is covered by the Demonstration Laboratory and has shown good programming practices, proper documentation and fair AI use including (commenting, formatting and software engineering design) if AI has been used, see fair AI use section below.
(20% of Marks)
- IV. Student has presented a **good summary and ownership** of what they have done from the Demonstration Laboratory as required by the Demonstrated Laboratory Sheet and what it means in the context of computer science and the learning objectives of the module.
(20% of Marks)

Fair AI Usage Requirements

AI tools are permitted and encouraged to support **exploration and experimentation**, rather than simply completing the assignment. **Simply copying the question into AI and copying the answer is not considered acceptable AI usage.** Students should demonstrate understanding of the core course

content being covered through the use of (and not limited to) meaningful interaction, such as refining prompts, trying different approaches, or evaluating and improving AI-generated results.

If AI is used, be prepared to explain its use and reasoning. Explanations with an AI reference is recommended and a shareable conversation link for web-based tools, or the prompt history (e.g., generate a `prompt_history.pdf`) for local tools such as Codex or Claude Code may be requested. Failure to provide the necessary evidence of your ownership of the assessment (see Ownership section) may be treated as an academic integrity/plagiarism issue.

Remarking Policy

Demonstrations are only allowed to be marked once, mainly because of human resources are finite and this is a large course, but also to be fair to your fellow students. This means you should get marked either when you're ready and completed the tasks or simply when you have completed as much as you will be able to due to various constraints. You are allowed to get marked early as long as you acknowledge the aforementioned restriction and that it is done when demonstrators have spare time when helping others in your practical session.
